*ISC's latest IT product offering – “You can't hack what you can't see”*

Information Support Concepts, Inc. Arlington, Texas: ISC has been providing innovative products to the IT professional going on 20 years --- the latest addition is not only innovative but has components of “Harry Potter’s” magic.

Up until now, security hardware has been utilized mostly by large companies due to the need for network manager involvement and the cost associated with the systems. Small, medium businesses (SMB's) simply didn't have the resources to accomplish the task. Now there is a product, Sentinel IPS that is affordable and managed 24/7 eliminating the need for time-consuming IT manager monitoring. While internal monitoring is eliminated or minimized, activity reports remain available through Sentinel.

ISC is making available to customers this exciting, new, highly efficient, and affordable intrusion prevention product. Sentinel IPS provides a “cloak of invisibility” protecting from malicious activity, intruders, and attackers. Normal network traffic remains unaffected after the installation of Sentinel equipment. The marauders of the internet are unable to penetrate the “cloak of invisibility” keeping the network safe from hackers and the hoards of intruders and purveyors of malicious activity. The user of the proprietary technology is not inconvenienced in any way. Once the system is in place, the back office

operation is handled by the Sentinel support staff. The product is available to SMB's concerned about security issues on an affordable monthly fee basis eliminating the need for a major capital expenditure.

Kevin Hunt, Sr. VP, Information Support Concepts stated, "We strive to bring our IT customers products that serve them well and make their job easier. We've done this over the years with rack mounts, innovative computer furniture and a wide range of quality products. I'm really excited about adding this outstanding state-of-the-art security product to an already outstanding roster of ISC products."

Information Support Concepts' agreement to represent Sentinel ISP is with the developer of the product, EcoNet.com Inc., a Dallas based company with a track record in network security. Patents are pending on AP Core Technology and Sentinel ISP. More information is available at [www.iscdfw.com](http://www.iscdfw.com)
